Overview

Main question

How to solve parabolic PDEs like:

$$\frac{\partial c}{\partial t} = \mathcal{D}\frac{\partial^2 c}{\partial x^2} - u\frac{\partial c}{\partial x} + R$$

$$t = 0; 0 \le x \le \ell \quad \Rightarrow c = c_0$$

with

$$t > 0; x = 0$$
 $\Rightarrow -\mathcal{D}\frac{\partial c}{\partial x} + uc = u_{in}c_{in}$

$$t > 0; x = \ell$$
 $\Rightarrow \frac{\partial c}{\partial x} = 0$

accurately and efficiently?

What is a PDE?

Introduction 000000000

Partial differential equation

An equation containing a function and their derivatives to multiple independent variables.

Order of PDE

The highest derivative appearing in the PDE

What is a PDE?

Introduction

Partial differential equation

An equation containing a function and their derivatives to multiple independent variables.

Order of PDE

The highest derivative appearing in the PDE

General second order PDE:

$$A\frac{\partial^2 f}{\partial x^2} + B\frac{\partial^2 f}{\partial x \partial y} + C\frac{\partial^2 f}{\partial y^2} + D\frac{\partial f}{\partial x} + E\frac{\partial f}{\partial y} + Ff = G$$

- Linear equation: Coefficients A, B, ..., G do not depend on x and y.
- Non-linear equation: Coefficients A, B, \dots, G are a function of x and y.

Classification of PDE's

$$A\frac{\partial^2 f}{\partial x^2} + B\frac{\partial^2 f}{\partial x \partial y} + C\frac{\partial^2 f}{\partial y^2} + D\frac{\partial f}{\partial x} + E\frac{\partial f}{\partial y} + Ff = G$$

The discriminant Δ of a quadratic polynomial is computed as (note: only the higher order coefficients are important):

$$\Delta = B^2 - 4AC$$

Introduction 000000000

Classification of PDE's

$$A\frac{\partial^2 f}{\partial x^2} + B\frac{\partial^2 f}{\partial x \partial y} + C\frac{\partial^2 f}{\partial y^2} + D\frac{\partial f}{\partial x} + E\frac{\partial f}{\partial y} + Ff = G$$

The discriminant Δ of a quadratic polynomial is computed as (note: only the higher order coefficients are important):

$$\Delta = B^2 - 4AC$$

Introduction

- ∆ < 0 ⇒ Elliptic equation (e.g. Laplace equation for stationary diffusion in 2D)
- $\Delta = 0 \Rightarrow$ Parabolic equation (e.g. instationary heat penetration in 1D)
- $\Delta > 0 \Rightarrow$ Hyperbolic equation (e.g. wave equation)

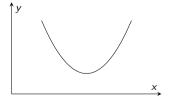

$$A\frac{\partial^2 f}{\partial x^2} + B\frac{\partial^2 f}{\partial x \partial y} + C\frac{\partial^2 f}{\partial y^2} + D\frac{\partial f}{\partial x} + E\frac{\partial f}{\partial y} + Ff = G$$

- Domain of dependence of point P points in xv-domain which influence the value of f in point P
- Range of influence of point P points in xy-domain which are influenced by the value of f in point P

Example elliptic PDE (boundary value problems: BVP)

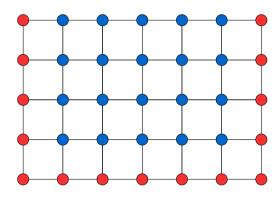

Grid point at which dependent variable has to be computed Grid point at which boundary condition is specified

Typical example: Poisson equation

$$\frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2} = f(x, y)$$

TENEXION permory requirements, CPU time) of the numerical method is of crucial importance.

 Grid point at which dependent variable has to be computed Grid point at which boundary condition is specified

Typical example: Poisson equation

Introduction 000000000

$$\frac{\partial c}{\partial t} + u \frac{\partial c}{\partial x} = \mathcal{D} \frac{\partial^2 c}{\partial x^2} + R$$

butter humerical sense) of the numerical method is of crucial importance.

Boundary conditions

• Dirichlet or fixed condition: prescribed value of f at boundary

$$f = f_0$$
 f_0 is a known function

• Neumann condition: prescribed value of derivative of f at boundary

$$\frac{\partial f}{\partial n} = q \qquad q \text{ is a known function}$$

• Mixed or Robin condition: relation between f and $\frac{\partial f}{\partial p}$ at boundary

$$a\frac{\partial f}{\partial p} + bf = c$$
 a, b and c are known functions

Boundary conditions

• Dirichlet or fixed condition: prescribed value of f at boundary

$$f = f_0$$
 f_0 is a known function

• Neumann condition: prescribed value of derivative of f at boundary

$$\frac{\partial f}{\partial p} = q$$
 q is a known function

• Mixed or Robin condition: relation between f and $\frac{\partial f}{\partial n}$ at boundary

$$a\frac{\partial f}{\partial n} + bf = c$$
 a, b and c are known functions

Boundary conditions

• Dirichlet or fixed condition: prescribed value of f at boundary

$$f = f_0$$
 f_0 is a known function

Neumann condition: prescribed value of derivative of f at boundary

$$\frac{\partial f}{\partial p} = q$$
 q is a known function

• Mixed or Robin condition: relation between f and $\frac{\partial f}{\partial n}$ at boundary

$$a\frac{\partial f}{\partial n} + bf = c$$
 a, b and c are known functions

Numerical solution method

Finite differences (method of lines, MOL):

- 1 Discretize spatial domain in discrete grid points
- Prind suitable approximation for the spatial derivatives
- Substitute approximations in PDE, which gives a system of ODE's, one for every grid points
- Advance in time with a suitable ODE solver

Alternative methods: collocation. Galerkin or Finite Element methods

Today's outline

- Conclusions

$$\frac{\partial c}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2}, \quad \text{with} \quad \begin{array}{l} t = 0; 0 \le x \le \ell \Rightarrow c = c_0 \\ t > 0; x = 0 \Rightarrow c = c_L \\ t > 0; x = \ell \Rightarrow c = c_R \end{array}$$

Second derivative
$$\frac{\partial^2 c}{\partial x^2}$$
 c_{i-1} c_i c_{i+1}

Instationary diffusion equation (Fick's second law)

$$\frac{\partial c}{\partial t} = \mathcal{D}\frac{\partial^2 c}{\partial x^2}, \quad \text{with} \quad \begin{array}{l} t = 0; 0 \le x \le \ell \Rightarrow c = c_0 \\ t > 0; x = 0 \Rightarrow c = c_L \\ t > 0; x = \ell \Rightarrow c = c_R \end{array}$$

Second derivative
$$\frac{\partial^2 c}{\partial x^2} \xrightarrow{c_{i-1}} \xrightarrow{c_i} \xrightarrow{c_i} \xrightarrow{c_{i+1}}$$
$$c_{i+1} = c_i + \frac{\partial c}{\partial x} \Big|_i \Delta x + \frac{1}{2} \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 + \frac{1}{6} \frac{\partial^3 c}{\partial x^3} \Big|_i \Delta x^3 + \dots$$
$$c_{i-1} = c_i - \frac{\partial c}{\partial x} \Big|_i \Delta x + \frac{1}{2} \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 - \frac{1}{6} \frac{\partial^3 c}{\partial x^3} \Big|_i \Delta x^3 + \dots$$

$$\frac{\partial c}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2}, \quad \text{with} \quad \begin{array}{l} t = 0; 0 \le x \le \ell \Rightarrow c = c_0 \\ t > 0; x = 0 \Rightarrow c = c_L \\ t > 0; x = \ell \Rightarrow c = c_R \end{array}$$

Second derivative
$$\frac{\partial^2 c}{\partial x^2}$$
 $\stackrel{c_{i-1}}{\bullet}$ $\stackrel{c_{i}}{\bullet}$ $\stackrel{c_{i+1}}{\bullet}$

$$c_{i+1} = c_i + \frac{\partial c}{\partial x} \Big|_i \Delta x + \frac{1}{2} \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 + \frac{1}{6} \frac{\partial^3 c}{\partial x^3} \Big|_i \Delta x^3 + \dots$$
$$c_{i-1} = c_i - \frac{\partial c}{\partial x} \Big|_i \Delta x + \frac{1}{2} \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 - \frac{1}{6} \frac{\partial^3 c}{\partial x^3} \Big|_i \Delta x^3 + \dots$$

$$c_{i+1} + c_{i-1} = 2c_i + \frac{\partial^2 c}{\partial x^2} \bigg|_i \Delta x^2 + \mathcal{O}(\Delta x^4)$$

$$\Rightarrow \frac{\partial^2 c}{\partial x^2} \bigg|_i = \frac{c_{i+1} - 2c_i + c_{i-1}}{\Delta x^2} + \mathcal{O}(\Delta x^2)$$

$$\frac{\partial c}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2}, \quad \text{with} \quad \begin{array}{l} t = 0; 0 \le x \le \ell \Rightarrow c = c_0 \\ t > 0; x = 0 \Rightarrow c = c_L \\ t > 0; x = \ell \Rightarrow c = c_R \end{array}$$

Second derivative
$$\frac{\partial^2 c}{\partial x^2}$$
 c_{i-1} c_i

$$c_{i+1} = c_i + \frac{\partial c}{\partial x} \Big|_i \Delta x + \frac{1}{2} \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 + \frac{1}{6} \frac{\partial^3 c}{\partial x^3} \Big|_i \Delta x^3 + \dots$$
$$c_{i-1} = c_i - \frac{\partial c}{\partial x} \Big|_i \Delta x + \frac{1}{2} \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 - \frac{1}{6} \frac{\partial^3 c}{\partial x^3} \Big|_i \Delta x^3 + \dots$$

$$\begin{vmatrix} c_{i+1} + c_{i-1} = 2c_i + \frac{\partial^2 c}{\partial x^2} \Big|_i \Delta x^2 + \mathcal{O}(\Delta x^4) \end{vmatrix}$$

$$\Rightarrow \frac{\partial^2 c}{\partial x^2} \Big|_i = \frac{c_{i+1} - 2c_i + c_{i-1}}{\Delta x^2} + \mathcal{O}(\Delta x^2)$$

Due to symmetric discretization: second order (central discretization).

An alternative discretization:

$$\frac{\partial^2 c}{\partial x^2}\bigg|_i = \frac{\frac{\partial c}{\partial x}\bigg|_{i+\frac{1}{2}} - \frac{\partial c}{\partial x}\bigg|_{i-\frac{1}{2}}}{\Delta x} + \mathcal{O}(\Delta x^2)$$

$$\frac{\partial^{2} c}{\partial x^{2}}\bigg|_{i} = \frac{\frac{\partial c}{\partial x}\bigg|_{i+\frac{1}{2}} - \frac{\partial c}{\partial x}\bigg|_{i-\frac{1}{2}}}{\Delta x} + \mathcal{O}(\Delta x^{2}) \qquad \underbrace{c_{i-1} \quad \frac{\partial c}{\partial x}\bigg|_{i-\frac{1}{2}} \quad c_{i} \quad \frac{\partial c}{\partial x}\bigg|_{i+\frac{1}{2}} \quad c_{i+1}}_{\bullet}$$

An alternative discretization:

$$\frac{\partial^{2} c}{\partial x^{2}}\Big|_{i} = \frac{\frac{\partial c}{\partial x}\Big|_{i+\frac{1}{2}} - \frac{\partial c}{\partial x}\Big|_{i-\frac{1}{2}}}{\Delta x} + \mathcal{O}(\Delta x^{2}) \qquad \underbrace{c_{i-1} \qquad \frac{\partial c}{\partial x}\Big|_{i-\frac{1}{2}} \quad c_{i} \qquad \frac{\partial c}{\partial x}\Big|_{i+\frac{1}{2}} \quad c_{i+1}}_{+\frac{1}{2}} \quad c_{i+1}$$

$$= \frac{c_{i+1} - c_{i}}{\Delta x} - \frac{c_{i} - c_{i-1}}{\Delta x}}{\Delta x} = \frac{c_{i+1} - 2c_{i} + c_{i-1}}{\Delta x^{2}}$$

An alternative discretization:

$$\frac{\partial^{2} c}{\partial x^{2}}\Big|_{i} = \frac{\frac{\partial c}{\partial x}\Big|_{i+\frac{1}{2}} - \frac{\partial c}{\partial x}\Big|_{i-\frac{1}{2}}}{\Delta x} + \mathcal{O}(\Delta x^{2}) \qquad \underbrace{c_{i-1} \quad \frac{\partial c}{\partial x}\Big|_{i-\frac{1}{2}} \quad c_{i} \quad \frac{\partial c}{\partial x}\Big|_{i+\frac{1}{2}} \quad c_{i+1}}_{=} \\ = \frac{c_{i+1} - c_{i}}{\Delta x} - \frac{c_{i} - c_{i-1}}{\Delta x}}{\Delta x} = \frac{c_{i+1} - 2c_{i} + c_{i-1}}{\Delta x^{2}}$$

This is convenient for the derivation of $\frac{\partial}{\partial x} \left(\mathcal{D} \frac{\partial c}{\partial x} \right)$:

$$\frac{\partial}{\partial x} \left(\mathcal{D} \frac{\partial c}{\partial x} \right) = \frac{\mathcal{D}_{i+\frac{1}{2}} \frac{\partial c}{\partial x} \Big|_{i+\frac{1}{2}} - \mathcal{D}_{i-\frac{1}{2}} \frac{\partial c}{\partial x} \Big|_{i-\frac{1}{2}}}{\Delta x} = \frac{\mathcal{D}_{i+\frac{1}{2}} \frac{c_{i+1} - c_i}{\Delta x} - \mathcal{D}_{i-\frac{1}{2}} \frac{c_i - c_{i-1}}{\Delta x}}{\Delta x}$$

$$= \frac{\mathcal{D}_{i+\frac{1}{2}} c_{i+1} - \left(\mathcal{D}_{i+\frac{1}{2}} + \mathcal{D}_{i-\frac{1}{2}} \right) c_i + \mathcal{D}_{i-\frac{1}{2}} c_{i-1}}{(\Delta x)^2}$$

$$\frac{\partial^2 f}{\partial x^2}$$

$$i-1$$
 $i-\frac{1}{2}$
 i
 $i+\frac{1}{2}$
 $i+1$

Instationary diffusion equation (Fick's second law)

$$\frac{\partial^2 f}{\partial x^2}$$
 $i - 1$ $i - \frac{1}{2}$ i $i + \frac{1}{2}$ $i + \frac{1}{2}$

$$f_{i+\frac{1}{2}} = f_i + \frac{1}{2}\Delta x \frac{\partial f}{\partial x} \Big|_i \Delta x + \frac{1}{2} \left(\frac{1}{2}\Delta x \right)^2 \frac{\partial^2 f}{\partial x^2} \Big|_i + \mathcal{O}(\Delta x^3)$$

$$f_{i-\frac{1}{2}} = f_i - \frac{1}{2}\Delta x \frac{\partial f}{\partial x} \Big|_i \Delta x + \frac{1}{2} \left(\frac{1}{2}\Delta x \right)^2 \frac{\partial^2 f}{\partial x^2} \Big|_i + \mathcal{O}(\Delta x^3)$$

$$f_{i+\frac{1}{2}} - f_{i-\frac{1}{2}} = \Delta x \frac{\partial f}{\partial x} + \mathcal{O}(\Delta x^3)$$

Instationary diffusion equation (Fick's second law)

$$\frac{\partial^2 f}{\partial x^2}$$
 $i - 1$ $i - \frac{1}{2}$ i $i + \frac{1}{2}$ $i + 1$

$$f_{i+\frac{1}{2}} = f_i + \frac{1}{2}\Delta x \frac{\partial f}{\partial x} \Big|_i \Delta x + \frac{1}{2} \left(\frac{1}{2}\Delta x \right)^2 \frac{\partial^2 f}{\partial x^2} \Big|_i + \mathcal{O}(\Delta x^3)$$

$$f_{i-\frac{1}{2}} = f_i - \frac{1}{2}\Delta x \frac{\partial f}{\partial x} \Big|_i \Delta x + \frac{1}{2} \left(\frac{1}{2}\Delta x \right)^2 \frac{\partial^2 f}{\partial x^2} \Big|_i + \mathcal{O}(\Delta x^3)$$

$$f_{i+\frac{1}{2}} - f_{i-\frac{1}{2}} = \Delta x \frac{\partial f}{\partial x} + \mathcal{O}(\Delta x^3)$$

$$\Rightarrow \frac{\partial f}{\partial x}\bigg|_{i} = \frac{f_{i+\frac{1}{2}} - f_{i-\frac{1}{2}}}{\Delta x} + \mathcal{O}(\Delta x^{2})$$

Substitution of spatial derivatives yields:

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Delta x^2} \quad \text{for } i = 0, \dots, N$$

Substitution of spatial derivatives yields:

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Lambda x^2} \quad \text{for } i = 0, \dots, N$$

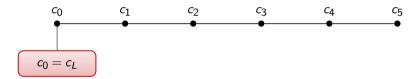

Instationary diffusion equation: spatial discretization

Substitution of spatial derivatives yields:

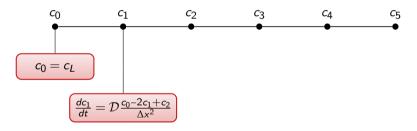

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Delta x^2} \quad \text{for } i = 0, \dots, N$$

Substitution of spatial derivatives yields:

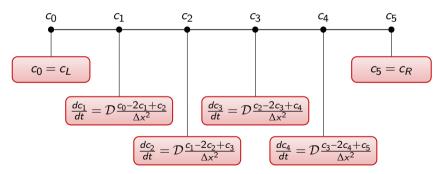

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Delta x^2} \quad \text{for } i = 0, \dots, N$$

Substitution of spatial derivatives yields:

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Delta x^2} \quad \text{for } i = 0, \dots, N$$

Instationary diffusion equation: boundary conditions

Two options:

• Keep boundary conditions as additional equations:

$$c_{0} = c_{L}, \frac{dc_{1}}{dt} = \mathcal{D}\frac{c_{0} - 2c_{1} + c_{2}}{\Delta x^{2}}, \frac{dc_{2}}{dt} = \mathcal{D}\frac{c_{1} - 2c_{2} + c_{3}}{\Delta x^{2}},$$

$$\frac{dc_{3}}{dt} = \mathcal{D}\frac{c_{2} - 2c_{3} + c_{4}}{\Delta x^{2}}, \frac{dc_{4}}{dt} = \mathcal{D}\frac{c_{3} - 2c_{4} + c_{5}}{\Delta x^{2}}, c_{5} = c_{R}$$

2 Substitute boundary conditions to reduce number of equations:

$$\begin{split} \frac{dc_{1}}{dt} &= \mathcal{D} \frac{c_{L} - 2c_{1} + c_{2}}{\Delta x^{2}}, \frac{dc_{2}}{dt} = \mathcal{D} \frac{c_{1} - 2c_{2} + c_{3}}{\Delta x^{2}}, \\ \frac{dc_{3}}{dt} &= \mathcal{D} \frac{c_{2} - 2c_{3} + c_{4}}{\Delta x^{2}}, \frac{dc_{4}}{dt} = \mathcal{D} \frac{c_{3} - 2c_{4} + c_{R}}{\Delta x^{2}} \end{split}$$

Instationary diffusion equation: boundary conditions

Two options:

Meep boundary conditions as additional equations:

$$c_{0} = c_{L}, \frac{dc_{1}}{dt} = \mathcal{D}\frac{c_{0} - 2c_{1} + c_{2}}{\Delta x^{2}}, \frac{dc_{2}}{dt} = \mathcal{D}\frac{c_{1} - 2c_{2} + c_{3}}{\Delta x^{2}},$$

$$\frac{dc_{3}}{dt} = \mathcal{D}\frac{c_{2} - 2c_{3} + c_{4}}{\Delta x^{2}}, \frac{dc_{4}}{dt} = \mathcal{D}\frac{c_{3} - 2c_{4} + c_{5}}{\Delta x^{2}}, c_{5} = c_{R}$$

Substitute boundary conditions to reduce number of equations:

$$\frac{dc_{1}}{dt} = \mathcal{D}\frac{c_{L} - 2c_{1} + c_{2}}{\Delta x^{2}}, \frac{dc_{2}}{dt} = \mathcal{D}\frac{c_{1} - 2c_{2} + c_{3}}{\Delta x^{2}}, \frac{dc_{3}}{\Delta t} = \mathcal{D}\frac{c_{2} - 2c_{3} + c_{4}}{\Delta x^{2}}, \frac{dc_{4}}{dt} = \mathcal{D}\frac{c_{3} - 2c_{4} + c_{R}}{\Delta x^{2}}$$

Instationary diffusion equation: temporal discretization

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Delta x^2}$$

Time discretization: forward Euler (explicit)

$$\frac{c_i^{n+1} - c_i^n}{\Delta t} = \mathcal{D}\frac{c_{i-1}^n - 2c_i^n + c_{i+1}^n}{\Delta x^2}$$

$$\Rightarrow c_i^{n+1} = \operatorname{Foc}_{i-1}^n + (1 - 2\operatorname{Fo})c_i^n + \operatorname{Foc}_{i+1}^n \quad \text{with Fo} = \frac{\mathcal{D}\Delta t}{\Delta x^2}$$

Straightforward updating (explicit equation), simple to implement in a program but stability constraint Fo = $\frac{D\Delta t}{\Delta v^2} < \frac{1}{2}!$

Small $\Delta x \Rightarrow$ small $\Delta t \Rightarrow$ patience required ©

$$\frac{dc_i}{dt} = \mathcal{D}\frac{c_{i-1} - 2c_i + c_{i+1}}{\Lambda x^2}$$

Time discretization: backward Euler (implicit)

$$\frac{c_{i}^{n+1} - c_{i}^{n}}{\Delta t} = \mathcal{D} \frac{c_{i-1}^{n+1} - 2c_{i}^{n+1} + c_{i+1}^{n+1}}{\Delta x^{2}}$$

$$\Rightarrow -\text{Foc}_{i-1}^{n+1} + (1 + 2\text{Fo})c_{i}^{n+1} - \text{Foc}_{i+1}^{n+1} = c_{i}^{n} \quad \text{with Fo} = \frac{\mathcal{D}\Delta t}{\Delta x^{2}}$$

Requires the solution of a system of linear equations, but no stability constraints!

Note: extension to higher order schemes (with time step adaptation) straightforward. Often second or third order optimal, because for each Euler-like step in the additional order an often large system needs to be solved (not treated in this course).

Solving the instationary diffusion equation: example

Solve the diffusion problem using explicit discretization:

$$\frac{\partial c_i}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2} \quad \text{with} \quad \begin{aligned} 0 &\leq x \leq \delta, \ \delta = 5 \cdot 10^{-3} \ \text{m} \\ \delta/\Delta x &= 100 \ \text{grid cells} \\ \mathcal{D} &= 1 \cdot 10^{-8} \ \text{m}^2 \ \text{s}^{-1} \\ t_{\text{end}} &= 5000 \ \text{s} \\ c_{\text{L}} &= 1 \ \text{mol m}^{-3} \ c_{\text{R}} = 0 \ \text{mol m}^{-3} \end{aligned}$$

Solve the diffusion problem using explicit discretization:

$$\frac{\partial c_i}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2} \quad \text{with} \quad \begin{array}{l} 0 \leq x \leq \delta, \ \delta = 5 \cdot 10^{-3} \ \text{m} \\ \delta/\Delta x = 100 \ \text{grid cells} \\ \mathcal{D} = 1 \cdot 10^{-8} \ \text{m}^2 \ \text{s}^{-1} \\ t_{\text{end}} = 5000 \ \text{s} \\ c_{\text{L}} = 1 \ \text{mol m}^{-3} \ c_{\text{R}} = 0 \ \text{mol m}^{-3} \end{array}$$

$$c_i^{n+1} = \operatorname{Fo} c_{i-1}^n + (1 - 2\operatorname{Fo})c_i^n + \operatorname{Fo} c_{i+1}^n$$
 with $\operatorname{Fo} = \frac{\mathcal{D}\Delta t}{\Delta x^2}$

Solve the diffusion problem using explicit discretization:

$$\frac{\partial c_i}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2} \quad \text{with} \quad \begin{aligned} 0 &\leq x \leq \delta, \ \delta = 5 \cdot 10^{-3} \ \text{m} \\ \delta/\Delta x &= 100 \ \text{grid cells} \\ \mathcal{D} &= 1 \cdot 10^{-8} \ \text{m}^2 \ \text{s}^{-1} \\ t_{\text{end}} &= 5000 \ \text{s} \\ c_{\text{L}} &= 1 \ \text{mol m}^{-3} \ c_{\text{R}} = 0 \ \text{mol m}^{-3} \end{aligned}$$

$$c_i^{n+1} = \operatorname{Fo} c_{i-1}^n + (1 - 2\operatorname{Fo})c_i^n + \operatorname{Fo} c_{i+1}^n$$
 with $\operatorname{Fo} = \frac{\mathcal{D}\Delta t}{\Delta x^2}$

- Initialise variables
- **2** Compute time step so that Fo $\leq \frac{1}{2} \Rightarrow \Delta t = 0.125$ s!
- 3 Compute 40000 time steps times 100 grid nodes!
- Store solution

Initialise the variables and matrices.

```
Nx = 100; % Nc grid points Nt = 40000; % Nt time steps
D = 1e-8:
            % m/s
c_L = 1.0; c_R = 0; \% mol/m3
t_{end} = 5000.0; % s
x_{end} = 5e-3; % m
% Time step and grid size
dt = t_end/Nt;
dx = x end/Nx:
% Fourier number
Fo=D*dt/dx/dx
% Initial matrices for solutions (Nx times Nt)
c = zeros(Nt+1.Nx+1): % All concentrations are zero
c(:,Nx+1) = c_R; % Concentration at right side
% Grid node and time step positions
x = linspace(0, x_end, Nx+1);
```

Solving the instationary diffusion equation: example

Compute the solution (nested time-and-grid loop):

```
for n = 1:Nt % time loop
   for i = 2:Nx % Nested loop for grid nodes
        c(n+1,i) = Fo*c(n,i-1) + (1-2*Fo)*c(n,i) + Fo*c(n,i+1);
   end
end
```

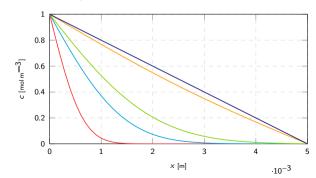

Compute the solution (nested time-and-grid loop):

```
for n = 1:Nt % time loop
   for i = 2:Nx % Nested loop for grid nodes
        c(n+1,i) = Fo*c(n,i-1) + (1-2*Fo)*c(n,i) + Fo*c(n,i+1);
    end
end
```

Plotting the solution at $t = \{12.5, 62.5, 125, 625, 5000\}$ s:

```
% Output times
outt = [12.5 62.5 125 625 5000]:
% Convert+round to time steps
outt dt = fix(outt/dt):
% Plot all time steps at once
plot(x,c(outt_dt,:))
```

A double-loop can impose serious computation times if the number of grid points increases:

```
for n = 1:Nt-1 \% time loop
    for i = 2:Nx % Nested loop for grid nodes
        c(n+1.i) = Fo*c(n.i-1) + (1-2*Fo)*c(n.i) + Fo*c(n.i+1):
    end
end
```

Remedy: vectorization. Construct a 3-point stencil Laplacian matrix first, then use the matrix product to evolve the simulation:

```
% Construct sparse matrix
e = ones(Nx-1.1):
md = [1: (1-2*Fo)*e: 1]:
1d = [Fo*e: 0: 0]:
ud = [0: 0: Fo*e:]:
A = spdiags([ld md ud], [-1 0 1], Nx+1, Nx+1);
% Faster for row-wise operations, so transpose
c=c':
for n = 1:Nt-1 \% time loop
    c(:,n+1) = A*c(:,n):
end
```

Linear system

To solve the linear system, we need to define matrix A. It is clear that storing many zeros is not efficient in terms of memory. We use a sparse matrix format. Two alternative ways to set up the matrix:

Set individual elements of the matrix:

```
% Bands in matrix (internal cells)
A = sparse(Nx+1,Nx+1);
for i=2:Nx
   A(i,i-1) = -Fo;
   A(i,i) = (1+2*Fo):
   A(i,i+1) = -Fo:
end
% Set boundary cells, only main diag:
A(1,1) = 1;
            % Left
A(Nx+1,Nx+1) = 1; % Right
```

Set matrix using bands:

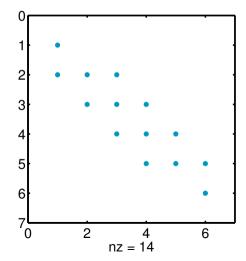

```
% Bands in matrix (internal cells)
e = ones(Nx-1.1): % Ones for internal cells
md = [1: e*(1+2*Fo): 1]: % Main diagonal
1d = [-e*Fo: 0: 0]: % Lower diagonal
hd = [0: 0: -e*Fo:]: % Upper diagonal
A = spdiags([ld md hd], [-1 0 1], Nx+1, Nx+1)
```

Note: The first argument of spdiags defines each column as a diagonal, starting at row 1 (for lower-diagonal) or column 1 (for upper-diagonal).

Solving the diffusion equation implicitly in Matlab

The command spy(A) shows a figure with the non-zero positions.

Solving the diffusion equation implicitly in Matlab

The concentration matrix is initialised and the boundary conditions are set as follows:

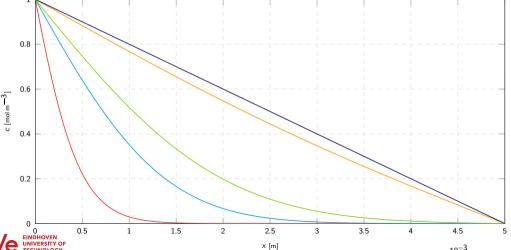

```
% Initial matrices for solutions (Nx times Nt)
c = zeros(Nt+1,Nx+1);  % All concentrations are zero
c(:,1) = c_L;  % Concentration at left side
c(:,Nx+1) = c_R;  % Concentration at right side
```

The right hand side vector (b) can now be set during the time-loop:

Solving the diffusion equation implicitly in Matlab

Plotting the solution at $t = \{12.5, 62.5, 125, 625, 5000\}$ s.

About explicit vs. implicit solutions

- Explicit solution:
 - Easy to implement
 - Very small time steps required.
 - This problem took about 0.5 s.
- Implicit solution:
 - Harder to implement, needs sparse matrix solver
 - No stability constraint
 - This problem took about 0.05 s
- The difference will become much larger for systems with e.g. more grid nodes!

Extension with non-linear source terms

$$\begin{array}{c} t = 0; 0 \leq x \leq \ell \Rightarrow c = c_0 \\ \frac{\partial c}{\partial t} = \mathcal{D} \frac{\partial^2 c}{\partial x^2} + R(c) \quad \text{with} \quad \begin{array}{c} t = 0; 0 \leq x \leq \ell \Rightarrow c = c_0 \\ t > 0; x = 0 \Rightarrow c = c_L \\ t > 0; x = \ell \Rightarrow c = c_R \end{array}$$

Extension with non-linear source terms

$$\begin{aligned} \frac{\partial c}{\partial t} &= \mathcal{D} \frac{\partial^2 c}{\partial x^2} + R(c) \quad \text{with} \quad \begin{aligned} t &= 0; 0 \le x \le \ell \Rightarrow c = c_0 \\ t &> 0; x = 0 \Rightarrow c = c_L \\ t &> 0; x = \ell \Rightarrow c = c_R \end{aligned}$$

• Forward Euler (explicit): simply add to right-hand side

$$\frac{c_{i}^{n+1} - c_{i}^{n}}{\Delta t} = \mathcal{D}\frac{c_{i-1}^{n} - 2c_{i}^{n} + c_{i+1}^{n}}{\Delta x^{2}} + R(c_{i}^{n})$$

$$\Rightarrow c_{i}^{n+1} = \text{Foc}_{i-1}^{n} + (1 - 2\text{Fo})c_{i}^{n} + \text{Foc}_{i+1}^{n} + R_{i}^{n}\Delta t$$

Extension with non-linear source terms

$$t = 0; 0 \le x \le \ell \Rightarrow c = c_0$$

$$\frac{\partial c}{\partial t} = \mathcal{D}\frac{\partial^2 c}{\partial x^2} + R(c) \quad \text{with} \quad t > 0; x = 0 \Rightarrow c = c_L$$

$$t > 0; x = \ell \Rightarrow c = c_R$$

Forward Euler (explicit): simply add to right-hand side

$$\frac{c_{i}^{n+1} - c_{i}^{n}}{\Delta t} = \mathcal{D} \frac{c_{i-1}^{n} - 2c_{i}^{n} + c_{i+1}^{n}}{\Delta x^{2}} + R(c_{i}^{n})$$

$$\Rightarrow c_{i}^{n+1} = \text{Fo}c_{i-1}^{n} + (1 - 2\text{Fo})c_{i}^{n} + \text{Fo}c_{i+1}^{n} + R_{i}^{n}\Delta t$$

Backward Euler (implicit): linearization required

$$R(c_i^{n+1}) = R(c_i^n) + \frac{dR}{dc} \Big|_i^n (c_i^{n+1} - c_i^n)$$

$$\frac{c_i^{n+1} - c_i^n}{\Delta t} = \mathcal{D} \frac{c_{i-1}^{n+1} - 2c_i^{n+1} + c_{i+1}^{n+1}}{\Delta x^2} + R(c_i^{n+1})$$

Convection

Extension with convection terms

$$\frac{\partial c}{\partial t} = \mathcal{D}\frac{\partial^2 c}{\partial x^2} - u\frac{\partial c}{\partial x} + R$$

Discretization of first derivative $\frac{dc}{dx}$, looks simple but is numerical headache!

Central discretization:

$$\frac{dc}{dx} = \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

⇒ simple and easy, too bad it doesn't work: yields unstable solutions if convection dominated.

Unsteady convection:

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Central difference for first derivative:

$$\frac{dc}{dx} = \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

Unsteady convection:

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Central difference for first derivative:

$$\frac{dc}{dx} = \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

$$\frac{c_{i}^{n+1} - c_{i}^{n}}{\Delta t} = -u \frac{c_{i+1} - c_{i-1}}{2\Delta x} \Rightarrow c_{i}^{n+1} = c_{i}^{n} - u \frac{c_{i+1}^{n} - c_{i-1}^{n}}{2\Delta x} \Delta t$$

Unsteady convection:

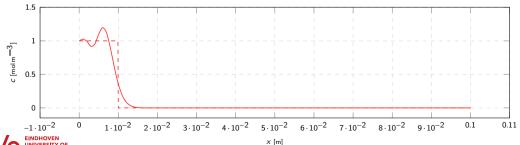

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Central difference for first derivative:

Convection 00000000

$$\frac{dc}{dx} = \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

$$\frac{c_{i}^{n+1} - c_{i}^{n}}{\Delta t} = -u \frac{c_{i+1} - c_{i-1}}{2\Delta x} \Rightarrow c_{i}^{n+1} = c_{i}^{n} - u \frac{c_{i+1}^{n} - c_{i-1}^{n}}{2\Delta x} \Delta t$$

Unsteady convection:

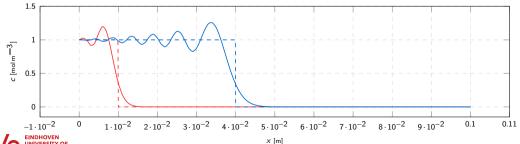

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Central difference for first derivative:

Convection 00000000

$$\frac{dc}{dx} = \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

$$\frac{c_i^{n+1}-c_i^n}{\Delta t}=-u\frac{c_{i+1}-c_{i-1}}{2\Delta x}\Rightarrow c_i^{n+1}=c_i^n-u\frac{c_{i+1}^n-c_{i-1}^n}{2\Delta x}\Delta t$$

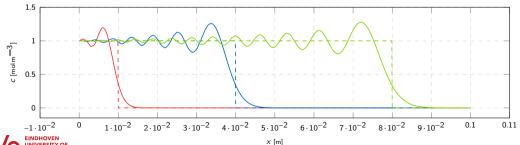

Unsteady convection:

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Central difference for first derivative:

$$\frac{dc}{dx} = \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

$$\frac{c_i^{n+1}-c_i^n}{\Delta t}=-u\frac{c_{i+1}-c_{i-1}}{2\Delta x}\Rightarrow c_i^{n+1}=c_i^n-u\frac{c_{i+1}^n-c_{i-1}^n}{2\Delta x}\Delta t$$

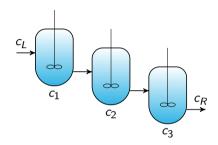

Convection

Extension with convection terms

Solution: upwind discretization, like CSTR's in series:

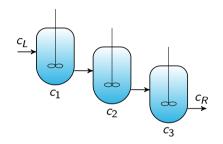

First order upwind:
$$-u\frac{dc}{dx}\Big|_{i} = \begin{cases} -u\frac{c_{i}-c_{i-1}}{\Delta x} & \text{if } u \geq 0 \\ -u\frac{c_{i+1}-c_{i}}{\Delta x} & \text{if } u < 0 \end{cases}$$

Convection 00000000

Extension with convection terms

Solution: upwind discretization, like CSTR's in series:

First order upwind:
$$-u\frac{dc}{dx}\Big|_i = \begin{cases} -u\frac{c_i - c_{i-1}}{\Delta x} & \text{if } u \ge 0 \\ -u\frac{c_{i+1} - c_i}{\Delta x} & \text{if } u < 0 \end{cases}$$
 Stable if $Co = \frac{u\Delta t}{\Delta x} < 1$ (with Co the

Courant number). However, only 1st order accurate (large smearing of concentration fronts).

First order upwind scheme of 1st derivative

Unsteady convection:

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Upwind scheme for first derivative:

$$-u\frac{dc}{dx}\bigg|_{i} = \begin{cases} -u\frac{c_{i}-c_{i-1}}{\Delta x} & \text{if } u \ge 0\\ -u\frac{c_{i+1}-c_{i}}{\Delta x} & \text{if } u < 0 \end{cases}$$

First order upwind scheme of 1st derivative

Unsteady convection:

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$

Upwind scheme for first derivative:

$$-u\frac{dc}{dx}\bigg|_{i} = \begin{cases} -u\frac{c_{i}-c_{i-1}}{\Delta x} & \text{if } u \ge 0\\ -u\frac{c_{i+1}-c_{i}}{\Delta x} & \text{if } u < 0 \end{cases}$$

$$\frac{c_i^{n+1} - c_i^n}{\Delta t} = -u \frac{c_{i+1} - c_{i-1}}{2\Delta x}$$

$$\Rightarrow c_i^{n+1} = \begin{cases} c_i^n - u\Delta t \frac{c_i - c_{i-1}}{\Delta x} & \text{if } u \ge 0 \\ c_i^n - u\Delta t \frac{c_{i+1} - c_i}{\Delta x} & \text{if } u < 0 \end{cases}$$

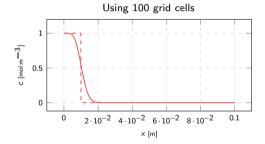

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x} \quad \text{with} \quad u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$$

Upwind scheme: example

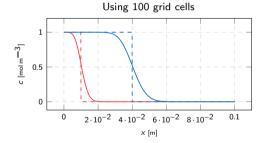

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$
 with $u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$

Upwind scheme: example

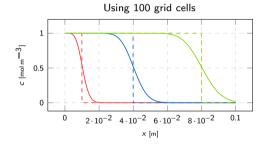

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$
 with $u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$

Upwind scheme: example

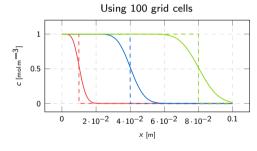

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x}$$
 with $u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$

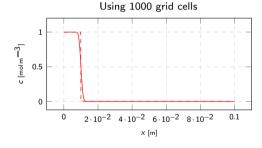

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x} \quad \text{with} \quad u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$$

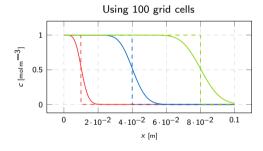

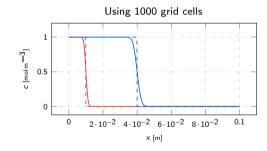

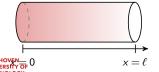

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x} \quad \text{with} \quad u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$$

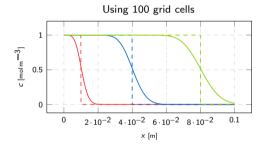

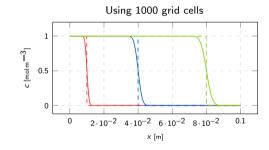

$$\frac{\partial c}{\partial t} = -u \frac{\partial c}{\partial x} \quad \text{with} \quad u = 0.1 \text{ms}^{-1} \Rightarrow c_i^{n+1} = c_i^n - u \frac{c_i - c_{i-1}}{\Delta x} \Delta t$$

The results from the previous slides were computed using this script:

```
Nx = 1000;
                 % Nc grid points
Nt = 10000;  % Nt time steps
u = 0.001; % m/s
c_in = 1.0; % mol/m3
t_end = 100.0;
x_{end} = 0.1;
% Time step and grid size
dt = t_end/Nt; dx = x_end/Nx;
% Courant number
Co = u * dt / dx
% Initial matrices for solutions (Nx times Nt)
c1 = zeros(Nt+1,Nx+1): % All concentrations are zero
c1(:.1) = c in: % Concentration at inlet (all time steps)
an = c1; c2 = c1; % Analytical and upwind solution
% Grid node and time step positions
x = linspace(0.x_end.Nx+1):
t = linspace(0,t_end,Nt+1);
```

Central difference and upwind in Matlab

(continued)

Convection

Today's outline

- Introduction
- Instationary diffusion equation
- Convection
- Conclusions
 - Other methods
 - Summary

- Explicit methods: straightforward extension
- Implicit methods: yields block-tridiagonal matrix (note ordering of equations: all variables per grid cell)

Extension to 2D or 3D systems

Spatial discretization in 2 directions — different methods available:

- Explicit
- Fully implicit
 - 1D gives tri-diagonal matrix
 - 2D gives penta-diagonal matrix
 - 3D gives hepta-diagonal matrix

Use of dedicated matrix solvers (e.g. ICCG, multigrid, ...)

- Alternating direction implicit (ADI)
 - Per direction implicit, but still overall unconditionally stable

Further extensions for parabolic PDEs

- Higher order temporal discretization (multi-step) with time step adaptation
- Non-uniform grids with automatic grid adaptation
- Higher-order discretization methods, especially higher order TVD (flux delimited) schemes for convective fluxes (e.g. WENO schemes)
- Higher-order finite volume schemes (Riemann solvers)

Summary

- Several classes of PDEs were introduced
 - Elliptic, Parabolic, Hyperbolic PDEs
- Diffusion equation: discretization of temporal and spatial domain was discussed
 - Solutions of the diffusion equation using explicit and implicit methods
 - How to add non-linear source terms
- Convection: upwind vs. central difference schemes
